Thank you very much.

One last question if you do not mind,
I have the results below from svyset declaration.

what should be the Method for variance estimation? I need to cluster standard errors according to region of birth(we have 12 regions).

```
svyset newpsu [pweight=v005], strata(strata) vce(linearized) singleunit(missing)
```

```
pweight: v005  
VCE: linearized  
Single unit: missing  
Strata 1: strata  
SU 1: newpsu  
FPC 1: <zero>
```

Regards
