Yes, it sounds like you should:

- 1) follow the procedure given to rename the men's variables to the same name as the women's variables,
 - 2) then concatenate a selected set of women;s and men's variables using the Add CASES command in SPSS,
 - 3) sort the combined data using SORT CASES and
 - 4) then merge the HIV data onto the combined women and men's data using MATCH FILES /FILE=* /TABLE=hiv dataset ...
-
