
Subject: Correct weight for a sub-sample

Hi,

I am working with the Cambodia DH surveys. My sample consists of the children for whom there are both anthropometric (hw variables) as well as nutritional (v414 or v469, depending on the survey year) information. The sample boils down to under 24-month olds who are the youngest child in their household. What is the appropriate weight to use in this case? v005?

Thank you in advance!
