Hi,

Could I request a separate topic for SPA analyses, or did I miss it in the user forum? It would be nice to see other questions posted about SPA data management and analysis.

My question pertains to the Malawi SPA sick child observation. In the sick child observation, diagnosis #203 (digestive system) contains 5 response categories (A,B,C,X,Y) but the dataset contains 6 variables (A B C D X Y). Could you please help map the questionnaire response categories (question 203) to dataset variable oc203 --- specifically what is the D category in the dataset?

Thanks  
Emily
