Subject: school enrollment
Posted by dhiman on Fri, 17 May 2013 03:36:25 GMT

Hi,
I need to create a dataset where the unit of observation will be the each living child in the household using DHS IV (1998-99) and V (2005-06) for India. The file should have information on school enrollment (of the child) and usual mother and household variables.

Can anyone please help me on how to merge the birth records data (with all children and mother variables) with the household member record (which has information on current enrolment).

Thanks
