Hello,

I would like to have some advice on the following:

The 2004 BDHS height-weight dataset doesn't have the key variable 'caseid' which is used to merge height-weight data with children's data. I fail to find a key variable that can be used to merge the two datasets (BDKR 2004 dataset & BDHW 2004 dataset). Can anyone please suggest how can I create the caseid variable or how can I merge the two datasets? Please note that I am using STATA.

Thanks in advance for help.

T
