Here is a response from one of our STATA experts Tom Pullum, that should answer your question.

Freddy --The attached programs will calculate the standard mortality rates, and confidence intervals for them, in Stata. The rates agree exactly with the DHS CPro programs. The confidence intervals are close but do not match exactly.

The programs are just text files but you can insert them into the Stata do-file editor. You will have to change the paths and the file name. This is set up for a Nigeria (NG) survey.

Let me know if you have problems. Cheers--Tom
