Hi all,

I am using the Ethiopia couples data for 2005 and 2011,

I know the couples record already has the male and female data linked/merged

and each couple is identified by the caseid but I am having trouble

summarizing the couples data in stata: for example I am interested in summary demographics of the couples ie. age, religion, wealth index etc. When I try to get information instead of a summary,

I get a long list (thousands) containing data for each couple. Please help! How do I get summary

statistics in stata version 11: so far I have been trying : by caseid: tab religion etc, what codes do I use in stata to produce statistics of my couples ie. each couples ages, education, religion etc?

Thank you in advance for your assistance, any help is much appreciated!

Fay
