Hi all,

I am using the Ethiopia couples data for 2005 and 2011,
I know the couples record already has the male and female data linked/merged and each couple is identified by the caseid but I am having trouble summarizing the couples data in stata: for example I am interested in summary demographics of the couples ie. age, religion, wealth index etc. When I try to get information instead of a summary, I get a long list (thousands) containing data for each couple. Please help! How do I get summary statistics in stata version 11: so far I have been trying: by caseid: tab religion etc, what codes do I use in stata to produce statistics of my couples ie. each couples ages, education, religion etc? Thank you in advance for your assistance, any help is much appreciated!
