Subject: getting indicator by only selected background characteristics

Hi,

I'm tyring to get estimates for an indicator ONLY at the national level AND by wealth quintile. I do not want other disaggregated estimates (e.g., by subnational region, as they take up the number of record/data greatly...). How can I do that? I see only "breakdown=all" (which gives all possible disaggregated estimates) or "breakdown=subnational" (which gives estimates by sub-national administrative unit). Many thanks in advance for help!

FYI, I'm using STATA, and here's my example.
** **********************************
insheetjson using " http://api.dhsprogram.com/rest/dhs/data?indicatorIds=3420200 0&breakdown=national&perpage=1000",

```
 gen str9  surveyid=""
 gen str20 group=""
 gen str20 grouplabel=""
 gen str5  value=""

#delimit;
insheetjson surveyid group grouplabel value
 using " http://api.dhsprogram.com/rest/dhs/data?indicatorIds=3420200
0&breakdown=national&perpage=1000",
 table(Data)
 col(SurveyId CharacteristicCategory CharacteristicLabel Value );
 #delimit cr

tab group,
```
