Thank you very much Reduced-For(u)m - I think these explanations help with thinking through my analysis.

If I may ask another question, which is best to use for multilevel modeling in Stata - xtmixed or gllamm? I have been reading some resources online, but am still unsure as to the correct command, especially with the need to apply survey weights in the regressions.

I would appreciate insight on this, and if possible some sample code that shows how this is done.

Best regards
