I was trying to run a logistic regression and got the following result.

xi: svy: logistic age_fmarcat i.highest_ed i.occupation i.religion i.wealth_index i.residence i.region i.ethnicity i.mass_med
i.highest_ed _Ihighest_e_0-2 (naturally coded; _Ihighest_e_0 omitted)
i.occupation _Ioccupatio_0-4 (naturally coded; _Ioccupatio_0 omitted)
i.religion _Ireligion_1-3 (naturally coded; _Ireligion_1 omitted)
i.wealth_index _Iwealth_in_1-3 (naturally coded; _Iwealth_in_1 omitted)
i.residence _Iresidence_1-2 (naturally coded; _Iresidence_1 omitted)
i.region _Iregion_1-10 (naturally coded; _Iregion_1 omitted)
i.ethnicity _Iethnicity_1-7 (naturally coded; _Iethnicity_1 omitted)
i.mass_med _Imass_med_0-1 (naturally coded; _Imass_med_0 omitted)
(running logistic on estimation sample)
an error occurred when svy executed logistic
r(2000);

end of do-file

r(2000);

Am kindly asking for help as I am failing to figure out what went wrong. Thanks.
