Hi, everyone. I am using NFHS 3 and 2 from India to study trends in child morbidity and care seeking behaviours and I use the child recode datasets. I noticed that with NFHS-1 the questionnaire available is a DHS II recode. Is it feasible to compare the NFHS-2 and NFHS-3 datasets with the household or individual raw datasets from the NFHS-1....since I am using the child as the unit of analysis?Thanks.
