Subject: Using svy: tab Posted by lexgw on Fri, 23 Oct 2015 15:03:59 GMT View Forum Message <> Reply to Message

Dear all, I am trying to learn how to run descriptive statistics in stata in order to replicate Uganda DHS 2011 statics on women and child health. I have two questions for help; 1. There are two ways of attaching weights to the variables and then tab:

gen wgt=v005/1000000 tab v025 [iweight=wgt]

This has worked and produced an output type of | place of | residence | Freq. Percent Cum. ----urban | 1,717.2704 19.80 19.80 rural | 6,956.7296 80.20 100.00 Total | 8,673.9999 100.00

Another method (recommended in DHS videos) is set for survey data and then tab

gen wgt=v005/1000000 svyset[pw=wgt], psu(v021) strata(v022) singleunit(centered) svy:tab v025

this has not worked pweight: wgt VCE: linearized Single unit: centered Strata 1: v022 SU 1: v021 FPC 1: <zero>

. svy:tab v025 no observations r(2000); What could be the problem?

2. which variables are suitable to capture child health and which data file is suitable to use to get these variables?

Gabriel
