Hi Luke,

I looked online and found this link for the UNHS 2010 report:  
<http://www.ubos.org/UNHS0910/unhs200910.pdf>. If you look at the sampling section, it says that :

The UNHS 2009/10 sample was designed to allow reliable estimation of key indicators for the Uganda, rural-urban, and separately for ten sub regions. A two-stage stratified sampling design was used. At the first stage, Enumeration Areas (EAs) were grouped by districts and rural-urban location; then drawn using Probability Proportional to Size (PPS). At the second stage, households which are the Ultimate Sampling Units were drawn using Systematic Sampling.

It looks like they used district (not sure if this is same as region?) and rural/urban for their stratification. Where were you looking where they said they didn't use rural/urban?
