And here is the code to calculate the total births, stillbirths and pregnancies of 7 or more months directly from the IR file without reshaping:

\* Open the Nepal 2001 dataset  
use "C:\Data\DHS\_Stata\NPIR41FL.DTA", clear

\* rename to facilitate looping

```
ren b?_92_0* b?_92_*  
ren b??_9_0* b??_9_*  
ren s2*_0* s2*_*
```

\* Calculate still births in the last 5 years

```
gen stillbirths = 0  
gen births = 0
```

```
forvalues i = 1/20 {
```

\* Data fixes

\* This case looks to have died on the first day rather than being a still birth

```
replace s216_`i'=1 if s227_`i'==. & s216_`i'==2
```

\* This case looks to have been misrecorded as born died rather than lost before full term

```
replace s216_`i'=3 if s227_`i'==3 & s216_`i'==2
```

\* Restrict to 60 months preceding survey

```
replace births = births+1 if b3_92_`i' > v008-60 & s216_`i'==1
```

```
replace stillbirths = stillbirths+1 if b3_92_`i' > v008-60 & s227_`i' != . & s227_`i' >= 7
```

```
}
```

```
gen totpreg7m = births+stillbirths
```

```
tab births [iw=v005/1000000]
```

```
tab stillbirths [iw=v005/1000000]
```

```
tab totpreg7m [iw=v005/1000000]
```
