To Whom It May Concern:

I am conducting an analysis using the Kenya SPA 2010, and I am wondering how to properly weight the data using Stata. In this dataset, the variable v005 is the sample weight. What variables should I use for the cluster/psu and strata information? I have found many descriptions of how the data was sampled in the reports and I know that the facilities were sampled based on a master list of facilities in the country (therefor a cluster wouldn't be relevant...), but I am wondering how to actually operationalize/execute this in Stata. What commands should I use?

Thank you.
