I'm analyzing data on Namibia Surbey and I don't understand some results. I'm using SPSS. In "child's age in months" I have a total sample of 9849 but missing 7904. When I analyse sex child o child is alive I have always a total sample of 9849 but the missing values are less, 4803 . Why we have more information about the sex of the child respect to te age?
