Hi,

I am originally a theoretician but very recently started to do some empirical analysis regarding Health care scenario in India. Primarily I want to focus on comparative analysis of different states of India. However, to start with I am interested in the state West Bengal (cod is 19 and denoted as WB). In NFHS III data set household data are given as HV024). But I need both state level and maximum possible disaggregated data. District and village level are my desired disaggregation. I am also very new in econometric software usage. I am using STATA and learning on my own. Can you please suggest me how to extract data only for West Bengal and for different districts and villages of West Bengal?

Thanks and regards,

BM
