Trevor-DHS wrote on Thu, 21 August 2014 11:15 Here is a simple example of creating a complex sampling plan using a women's recode (IR) data file (open the data file before running the commands):

* Create weight variable.
compute wt = V005/1000000.
* Define strata variable, sometimes V022, V023, or combination of V024 and V025.
compute strata = V022.
* or urban/rural within region..
compute strata = V024*2 + V025.

CSPLAN ANALYSIS

```
/PLAN FILE='C:\Temp\DHS_IR.csplan'  
/PLANVARS ANALYSISWEIGHT=wt  
/DESIGN STRATA= strata CLUSTER= V021  
/ESTIMATOR TYPE=WR.
```

* Define variable to use in analysis.
* Secondary education or higher.
compute sec = (V106 = 2 or V106 = 3).

* Complex Samples Descriptives.

CSDESCRIPTIVES

```
/PLAN FILE = 'C:\Temp\DHS_IR.csplan'  
/SUMMARY VARIABLES = sec  
/MEAN  
/STATISTICS SE CV COUNT POPSIZE DEFF DEFFSQRT CIN  
/MISSING SCOPE = ANALYSIS CLASSMISSING = EXCLUDE.
```

Awesome. thanks Trevor for the example, this will give me something to work off.
