The Maldives 2009 survey is an ever-married women survey (that is only ever-married women were interviewed). To get estimates for all women such as the indicator below you need to apply all women factors to the denominators to inflate them to all women. This is described in other posts on the forum - see the post here. Once you inflate the denominator to all women you will get  $84.476 / 2161 = 3.9\%$ .
