I am working on project about contraceptive use in Malawi and I am using DHS data for the years 2000, 2004, and 2010. My problem is that I cannot identify 17 or 18 districts in the 2004 dataset. The variable sdist2 has unique codes for each district but there are no names. On the other hand variable sdist has names for 10 districts and all the other districts are combined under the name of "all other districts". For the other years everything is fine. I need help to identify the districts in variable sdist2 by name.
