Hi,

I'm am still a little confused as to how to use the all women's factor. For logistic regression, do I use it as part of the survey set?

```
svyset[pweight = sample_wt], psu (psu) strata(sample_domain)
```

```
svy: logistic overweight i.employmentFinal chldage_mo ...
```

I am also using education a as covariate so then I would seem I need to use the all women's education factor for just that variable and the total for the other variables in the regression?

Thanks for your assistance !

Vanessa
