Thank you Liz!

I have an another question about anthropometric scores in PR file and in KR file. I know that the PR file contains the data for all household members and visitors and the KR file only includes the data for children listed in the PR file whose mother was also listed in the PR file and was interviewed. Thus children under 5 in PR file must be higher than children under 5 in KR file. With DHS 2010 of Burkina Faso, DHS 2006 an 2012 of Niger, this is different. There are more children in KR file than in PR file. Is it exact? il yes what is the justification?

Thank you!
