I am trying to measure the impact of the Ivory Coast civil war on educational attainments using DID, for my control variables I am trying to construct a variable for the number of siblings in the household and a variable for the household member order (oldest, youngest...)

*V218 in the birth recode indicates the total number of living children in the household, is there any way to generate number of siblings variable using v218?

* How to generate a household member rank variable?

Thank you for your help!
