Dear forum members,

I am currently working on the Burkina Faso household data (bfpr70SV) from MIS 2014. My study is related to utilization of mosquito net.

The bfpr70 dataset contains 39529 cases, however the published report says that the survey was conducted on 7600 women from 6500 households. Thus it is causing certain confusions. I would like to know if-

1) 39539 is the summation of all men, women and children surveyed from those 6500 households.

2) bfpr70 is the right dataset to analyse to measure the prevalence of mosquito nets utilization in BF regardless of age (adult/children) and gender (men/women).

Thanks in advance for your reply!

Nile
