I need help with creating a variable that shows all the information on the Death by age in months. I am working with the women and Child file in the 2013-14 Zambia Demographic Survey dataset, I noticed there is more than one Variable showing this information. For example age at death is found in the following b7_01, b7_02 all the way through to b7_20. What I need is a Variable that combines all this information into one variable B7(age at Death, months)

Thanks,
