I have tried to merge the Nigeria 2013 household and individual data (which contains the appended male and female recode) but It doesn't merge.

I have asked some colleagues and was told it's impossible to get the living arrangement of youth aged 15-24 in a household as the question was only asked for children below age 15. I was also told that I could use the PR recode alone for the analysis without having to link with individual files but I am struggling with that.

I would like to get some help on this issue.
