I'm using Egypt 2014 KR file to analyze the relationship between dietary diversity and child health status (eg. stunting).

I'm planning to use mothers' health condition as a control factor, so I would like to merge those data in the IR file to the KR file.

Especially I'm interested in a variable "v763a (any sexually transmitted diseases last 12 months)", which is not included in KR file but IR file.

If anyone guide me how I can do this, I would really appreciate it.

Thank you in advance.

This kind of question on merging has come up many times on the forum. If you search with keyword "merge" you should find answers to your question on merging IR and KR files.
