HI!

CASEIDs are not developed for above mentioned files. Moreover Common identifiers are hard to compile before merging data files.

Research questions "How much C-Sections are conducted at Public and PVT facilities" In this regards we need to have independent variable of fertility, Residence, Regions, Education, Wealth Status, Single/Multiple Births before, ANC Visits, Timing of decision to conduct C-section.

Dependent Variable is C-Sections Conducted at Public and Pvt facility, Respectively.

Kindly guide me how can have datafiles having most recent live births in the 3 years preceding the survey (It will be my final data file) ?

If you support me with SPSS syntax for it thn it will be highly supportive for us.

We need urgent support.

Regards,  
Waqas Imran

Following is a response from DHS Research & Data Analysis Director, Tom Pullum:

This was a very specific survey, much different from a standard DHS survey. We cannot provide support for it. You may want to contact the National Institute of Population Studies (<https://www.nips.org.pk/>).
