Dear sir or madam,

I would like to ask about weighting in merging KR and HR files.  
My unit of analysis is children aged 0-23 months.

So, Is it okay weighting like v005/1000000 or do i need to modify weighting formula?

These are the weights for the different sample selections/units of analysis:

Unit of analysis  
Households: hv005  
Household members: hv005  
Women: v005  
Children: v005  
Men: mv005  
Domestic Violence: d005  
HIV test results: hiv05

You need to divide the sampling weight by 1,000,000.

Examples:

In Stata:  
generate wgt = v005/1000000  
tab var [iweight=wgt]

In SPSS:  
COMPUTE WGT = V005/1000000.  
WEIGHT by WGT.
