Dear Sir,

I am trying to use SAS dataset in SAS 9.3 here my problem is in individual file birth history the same variable repeat 15 times because of 15 members in the household. but i need to arrange data like one by one household. please can you suggest me how to go about it?

data looks like

```
case_ID  age1  birth_date1  sex1  twin_child1  age2  birth_date2  sex2  twin_child2
```

but i need to arrange data like this

```
case_ID  age  birth_date  sex  twin_child
```

```
1  
2  
3
```

please help me in this as per as possible. my email ID- anilgvdbm@gmail.com

Thanks in Advance...

Anil

For children's level analysis, use the Children's Recode (KR). This dataset has one record for every child of eligible women, born in the last five years. It contains the information related to the child's pregnancy and postnatal care and immunization and health. The data for the mother of each of these children is included. This file is used to look at child health indicators such as immunization coverage, vitamin A supplementation, and recent occurrences of diarrhea, fever, and cough for young children and treatment of childhood diseases. The unit of analysis (case) in this file is the children of women born in the last 5 years (0-59 months).

For births' level analysis, use the All Children's Recode (BR). This dataset has one record for every child ever born of eligible women. Essentially, it is the full birth history of all women interviewed including its information on pregnancy and postnatal care as well as immunization and health for children born in the last 5 years. Data for the mother of each of these children is also included. This file can be used to calculate health indicators as well as fertility and mortality rates. The unit of analysis (case) in this file is the children ever born of eligible women.
