I am looking for any analysis of Knowledge of days when a woman is more likely to become pregnant. Are the result of this question included in DHS reports? Is it possible to get this analysis in stata compiler are one needs to download the data and do analysis? I want to see if lack of knowledge of days when one is likely to become pregnant is associated with unwanted pregnancy especially among adolescents.

regards
Patrick

Thank you for submitting your question. Could you please provide some more detailed information so we can better advise you?

Can you let us know:

- Which survey you are using (Include country name and year)?
- Which data files you are referring to?
- Which software you are using (Stata, SPSS, R, etc.)?

If you are trying to match a Table in a final report, please also indicate which table and which estimate you are trying to match.

Women are more likely to be fertile at the time of ovulation. Ovulation means when eggs are released from the ovaries.

This is the period of 12 to 14 days of your next period.

For example, if womens's menses cycle is of 28 days. She had her last period on 12th of that month. Then she can be ovulating from 1st of next month. In this way, women is more likely to become pregnant just before 12 to 14 days of her menses cycle.
