I want to calculate the grade a person has completed by the year of the interview conducted.

I checked for variables v107 and v106 in Malawi DHS data using BR file.

When restricted to, age between 7-11 and then to the primary education and look into the ages, the age of 7 years are in category 8 in v107 variable.

I'm confused on the categorization of this level of highest year of education and the age.

Restricted to primary education;

highest educational level	Freq.	Percent	Cum.
-----+-----			
primary	13,541	100.00	100.00
-----+-----			
Total	13,541	100.00	

The tabulation shows the age group 7 who have completed 6, 7, 8 years as shown below;

tab v107 b8

highest year of education	7	current age of child				11	Total
-----+-----							
no years completed at	70	49	61	54	44	278	
1	219	206	208	209	190	1,032	
2	353	320	305	340	276	1,594	
3	403	398	326	377	309	1,813	
4	356	353	307	340	265	1,621	
5	419	360	345	375	280	1,779	
6	401	347	318	324	270	1,660	
7	462	413	365	343	366	1,949	
8	409	391	374	366	275	1,815	
-----+-----							
Total	3,092	2,837	2,609	2,728	2,275	13,541	

1. Is it correct to identify the v107 year as the grade a person may attend in school, or what is the interpretation of the categorization,

2. Could you please tell me how to calculate the primary school grade a person is in, for the survey year, that is compatible with the age.

thank you so much!

Following is a response from DHS staff member, Tom Pullum:

To find out what is the normative grade of school for a child of a given age, you would have to look into information about each country. You can try to approach the question empirically, although there are some complications and unknowns. The birthdate of the child should be compared with the cutoff birthdate for eligibility. The timing of the survey within the school year would make a difference (about $\frac{3}{4}$ of children will have a birthday within a 9-month school year). Also some kids will fail a grade and some will skip a grade. There is usually some degree of misreporting by the household respondent.

I went to the PR file for the Malawi 2015-16 survey and entered the following lines: "tab hv123 if hv122==1, summarize(hv105)" and "tab hv123 if hv122==2, summarize(hv105)". There is a very regular progression in the mean age of children in each year of primary school and secondary school. These tables also show that Malawi has (or had) 8 years of primary grades and 4 years of secondary grades. In some other countries you would find 6+6. I think these tables should be helpful for establishing the correspondence between age and grade.
