Data on frequency of aerated drinks and data on morbidity: cardiovascular diseases, type-2 diabetes mellitus, liver diseases, bone density and dental health. At times, I saw that such data is available on one of the NFHS datasets and not others, but they can't be combined. Also, I have read certain research papers where similar variables as mentioned above have been used but when I saw the data, I could not find them. I want to use the NFHS-4 dataset for my study. Please help me with this.

Apart from this, if possible can you please tell me where can I find the data for taxation rates on aerated drinks in different states in India around the same time?

Thanks and Regards

Following is a response from DHS staff member, Tom Pullum:

Your question is outside the scope of this forum. The NFHS-4 does not contain the kind of data you are looking for. Please look at the final report on the survey (<https://www.dhsprogram.com/pubs/pdf/FR339/FR339.pdf>), or the questionnaire, for the information and topics included in this survey.
