
Subject: Extracting values from geospatial covariates to GPS points.

Hi, I have been using DHS GPS points in the past, and used buffers around the points when extracting values from geospatial covariates (2km if urban cluster, 5km buffer if rural cluster). Now I have come across this paper https://spatialdata.dhsprogram.com/references/DHS_Covariates_Extract_Data_Description_3.pdf and I was wondering if the overall guidelines on extraction are moving away from the buffers method to extracting to the actual point (although displaced)? Many thanks!

Hi geoK

We are not moving away from the buffer method. When we began our geospatial modeling work, we modified the covariate extraction process to obtain direct point pixel values from the resampled/aggregated 5x5km layers. We are switching back to the buffer approach in the next version of our covariate manual, which we expect will be released this year.
