Hello

Hello

I am a student and I have a research topic on trends in socioeconomic inequalities in the use of modern contraceptives in Burkina Faso from 2003 to 2021.

My socioeconomic variables are: wealth quintile and education level of the woman and the health variable is binary coded 1 "yes" and 0 "no".

I am requesting help for the decomposition of the wagstaff concentration index in order to estimate the contribution to inequalities related to wealth and education.

Thank you
