The outcome of my study is hemoglobin level. How should it be weighted? Should it also be weighted if there are continuity variables in the covariate

There have been many previous postings on weighting. You could go to the GitHub programs (<https://github.com/DHSProgram/DHS-Indicators-Stata>) and search for "weight", "svyset", and "svy:". You can also check this part of the forum: https://userforum.dhsprogram.com/index.php?t=thread&frm_id=33& or search for those keywords on the forum itself.

If I want to do a multivariate logis regression analysis, should I use weights, but I find that after adding weights=wt, the code doesn't run
