The outcome of my study is hemoglobin level. How should it be weighted? Should it also be weighted if there are continuity variables in the covariate

If I want to do a multivariate logis regression analysis, should I use weights, but I find that after adding weights=wt, the code doesn't run

There have been many postings on weighting. You could go to the GitHub programs (https://github.com/DHSProgram/DHS-Indicators-Stata) and search for "weight", "svyset", and "svy:". You can also check this part of the forum:
https://userforum.dhsprogram.com/index.php?t=thread&frm_ id=33&
or simply search for those keywords on the forum itself.
