Subject: Discrepancies in the data when comparing STATcompiler values with the final reports

Hello,

I have noticed discrepancies in the percentage values when analyzing and comparing the percentages of households with improved water and sanitation facilities between STATcompiler and the final DHS reports. For example, in the 2015 Afghanistan DHS, the percentage of households with an improved source of drinking water is listed as 71.2% in STATcompiler, while the report states it as 65.3%.

Are there mistakes on STATcompiler?

Any help is greatly appreciated !

Thank you
