I have two questions about the weight when analyzing DHS. First, if I want to match two types of files, such as PR and KR files, how should the weights be set? In addition, if I want to conduct multi-level regression analysis, the first level is the region (v024) at the time of the survey, and the second level is PSU (v021), may I ask how to set my weights in this multi-level logistic regression

When merging PR and KR files, be sure to apply appropriate weights from each file to maintain accuracy in your analysis.
