I have prepared a syntax for calculating the perinatal mortality rate in Stata with guidance from this forum. However, my results do not match the numbers in the official report, and I am unsure where I might have gone wrong. Could you please review my syntax to help identify any errors? Additionally, I am finding the syntax on GitHub for calculating perinatal deaths quite complex. If possible, could you provide a simplified version of perinatal death equation in Stata?

Following is a response from DHS staff member, Tom Pullum:

With DHS-8 data and the birth histories it is now much easier to calculate the perinatal mortality rate. I will paste below the Stata lines to do it, using the new GR file. It includes code for one covariate (wealth quintiles) and the total.

We have written new Stata code for Chapters 5 and 8 but it may not yet be posted on the GitHub site.

* Table 8.4 in Bangladesh 2022 DHS final report

* Use the GR file for DHS8 surveys

use "...BDGR81FL.DTA", clear

* Reduce the file to births and stillbirths in months 0-59 before the survey

keep if p19<60 & (p32==1 | p32==2)

gen wt=v005/1000000

* Construct the outcome variables

gen stillbirth=0

gen enn_death=0

replace stillbirth=1 if p32==2

replace enn_death=1 if p32==1 & p6<=106

replace stillbirth=stillbirth*wt

replace enn_death=enn_death*wt

gen case=wt

collapse (sum) stillbirth enn_death case, by(v190)

gen st_rate=1000*stillbirth/case

gen enn_rate=1000*enn_death/case

gen peri_rate=st_rate+enn_rate

gen ratio=stillbirth/enn_death

list, table clean

collapse (sum) stillbirth enn_death case

gen st_rate=1000*stillbirth/case

gen enn_rate=1000*enn_death/case

gen peri_rate=st_rate+enn_rate

gen ratio=stillbirth/enn_death

list, table clean

Wow, it's great! I also want to know regarding essential newborn care, if data on "baby dried <5 min of birth" and "baby wrapped <5 min of birth" are available in DHS-8. If so, could you let me know the variable numbers.

Following is a response from DHS staff member, Tom Pullum:

Those variables are not included in DHS surveys. To find out which antenatal and postnatal variables are in the data, you can open the GR file in Stata and enter "describe m*". (Also

"describe s*" in other surveys but I see nothing relevant among the "s" variables in this survey.) The variables most relevant to your question have the prefix "mnb" ("nb" for newborn.) You can also look at the questionnaire.
