---

timing of pregnancy determine the maternal and neonatal outcome which inturn vital for public and clinical implication of maternal and neonatal health.

the objective is

1. to estimate the prevalence of short and long interpregnancy interval
2. to findout the public and clinical implication of short and long interpregnancy interval and maternal and neonatal outcome

Dear DHS expert,i am troubling to findout the prevalence of short and long interpregnancy interval.

the important variable i need to calculate IPI are Last birth to interview and Time since last menstruation. but the variable Time since last birth is NA. so how can i find the interval from 2019 EDHS data? if i consider those who are pregnant i miss the pregnancy outcome,bcs my objective the impact of IPI on maternal and neonatal outcome. please help me
