Hi every one

I want to analyze the effect of fertility on nutritional status of children and children enrollment in school in Tanzania. However, the problem I am facing is on how to run them in them regression since fertility is endogenous in the child and education equation. This means therefore, that fertility will be proxied using instrumental variables. Any idea on how to run these commands

Well, in Stata you could use "ivreg2" - <http://www.repec.org/bocode/i/ivreg2.html>

If you have further questions on that, the Stata user's forum is the place to go. But finding a valid instrument for fertility won't be easy - there is a paper that uses maternal infertility as an instrument: [https://www.aeaweb.org/annual\\_mtg\\_papers/2008/2008\\_606.pdf](https://www.aeaweb.org/annual_mtg_papers/2008/2008_606.pdf)
