Hi,  
How do I find recoded variable name for uterine prolapse (for stata)? I searched in DHS recode manual but couldn't find it. How will I be able to get information on it?  
Mala

Dear User,  
If a question regarding uterine prolapse was asked it was probably country specific. All country specific variables should be recoded in the recode as the question number but starting with an S. for example: Q729 would be S729. The list of country specif variables is provided in the documentation distributed with each data set. It is usually a Word file.
