Good morning, I am currently working on the Colombia 2010 DHS dataset

I am interested to aggregate some variables by municipality

I analyzed the distribution of the variable shmunip and I found out that

20,804 cases are characterized by a value equal to 1.

the cross-tabulation with region (v024) or dept (shdepto)

and I observed a one to many relation,

whereas I found a one-to-one match when focusing

on region & departments.

I was expecting a sort of multilevel arrangement

region > dept > municipality

Could somebody please explain me in some details

how should I interpret these findings or where I am incorrectly

interpreting the meaning of the variables?

Thank you very much for your help

Following is a response from Senior DHS Data Processing Specialist, Nouredine Abderrahim:

The definition of the geographic identification of the household is set by the implementing agency.

You may contact the implementing agency of the survey at the address shown in the final report

which can be downloaded from the www.DHSprogram.com website.
