Subject: using svy function to run cross tabs Posted by pkaburi on Wed, 21 Oct 2015 20:19:55 GMT View Forum Message <> Reply to Message

I am using KDHS 2008 data. I want to do a ttest for v012 by v761. when i run the following command svy: ttest v012 if v761<=3, over(v761), i get the following response.

ttest is not supported by svy with vce(linearized.

what should i do?

One option would be to run OLS ("reg") with dummy variables for the 3 categories of v761 you want (no constant). Then you could use the "test" commands to test the equality of the groups (in whatever pair-wise or all-at-once way you wanted).

That would account for all of the survey design as long as you used the "svy" prefix before the regression. I think that should work.
