Subject: Repitition of the same variable Posted by brammaputram@yahoo.fr on Fri, 06 Nov 2015 03:38:20 GMT View Forum Message <> Reply to Message

Dear Forum experts

I am a new user of BDHS data and having confusions in figuring the meaning of repetation of the same variables for a certain number of times.

For Bangladesh (BDIR), in many cases same data appear sometimes for 20 and sometimes for 6 times for the same variables e.g. Anemia level, Agrees to referral, Height/Age standard deviation (screenshot attached).

My question is, as there are six (multiple) observations for the same variable, which one am I supposed to select for analysis.

I would remain especially grateful if anyone could help me clarify the matter.

Thanks in advance...

There are several discussions on the forum on "multiple occurrence variables". Once such discussion can be found at post 3164.
