Hello,

I am trying to determine whether there is a difference in unmet need between HIV-positive and negative women. Using Stata, how do I go about merging the women's and HIV biomarkers datasets in order to run the analysis?

I am a novice; any help you can provide is appreciated.

Thank you.

There are several posts in the forum on merging datasets in stata. Please do a search on the Forum to get some guidance. A couple of these posts are found at:
