I'm analyzing data on Namibia Survey and I don't understand some results. I'm using SPSS. In "child's age in months" I have a total sample of 9849 but missing 7904. When I analyse sex child or child is alive I have always a total sample of 9849 but the missing values are less, 4803. Why we have more information about the sex of the child respect to the age?

We can't match the numbers you are giving. Specifically which dataset name are you using?

Hello, I'm having problems with missing data also in the Couples Recode-Namibia 2013 SAS dataset. Although "Table 14.6 Attitudes toward negotiating safer sexual relations with husband" includes statistics for Namibia 2013, the survey question's data is blank in SAS. Please assist.

Dear User,  
Do you still need assistance with this post?  
Thank you!

See variables v633b and mv633b for refusing to have sex because husband has other women, and v822 and mv822 for asking to use a condom if husband has an STI.
